

Karina Castillo

Reflection:

I started by adding the new variables needed for the quote class in quote.dart. Next, I added the new features that were static such as tag, themes, and date in quote_card.dart. I found it tricky to add the stage changes like likes-counter and delete confirmation. I finished by changing the quotes in main.dart and UI polishing in quote_card.dart.

Changes:

- Added cardColor depending on each quote type [quote_card]
- Changed QuoteCard from Stateless to Stateful to [quote_card]
- Added a delete confirmation [quote_card]
 - o Made confirm Delete a Future<void>
- Stylized Quote Card for better UI experience [quote_card]
- Updated pubspec.yaml environment to 3.0.0 and added dependencies likes intl
- Added Quote.dart final variables to include all new added features mentioned above with defaults
- Changed from default quotes to my own favorites [main.dart]
- Changed background color [main.dart]
- Added onDelete setState [main.dart]

Tricky things:

1. Making changes from Dart 2 to Dart 3
 - a. Adding null safety: The tutorial code was done before dart required null safety, so I had to update certain lines of code. For example, adding 'required' to class initialization.
2. Connecting onDelete setState and making it functional => I ended up moving the setstate to main.dart
3. Figuring out where cardColor goes in the context of the widgets => moved it above the widgets
4. Getting confirmDelete to alert and actually delete on quote_card.dart => created it as a future<void> & sper.key
5. Figuring out exactly where does formattedDate go inside of a Widget
6. Formatting the quote card on quote_card.dart to be visually appealing with the icon in spaces that makes sense. For example, the like icon and the delete icon on the far right
